Introduction

The commercial real estate sector is at a pivotal moment. As more U.S. cities adopt climate action plans along with stricter, performance-based energy codes and standards, practitioners must rise to face the huge challenges of reducing building emissions amid an office landscape transformed by a global pandemic. With tenants in leased spaces typically consuming more than half of a commercial building's energy, all commercial real estate stakeholders must work together to unlock substantial energy and carbon reductions in office buildings.

This playbook includes key insights and a suite of actionable resources to support **Building Owners & Managers** in prioritizing building performance and incorporating decarbonization strategies across various phases of the leasing cycle.

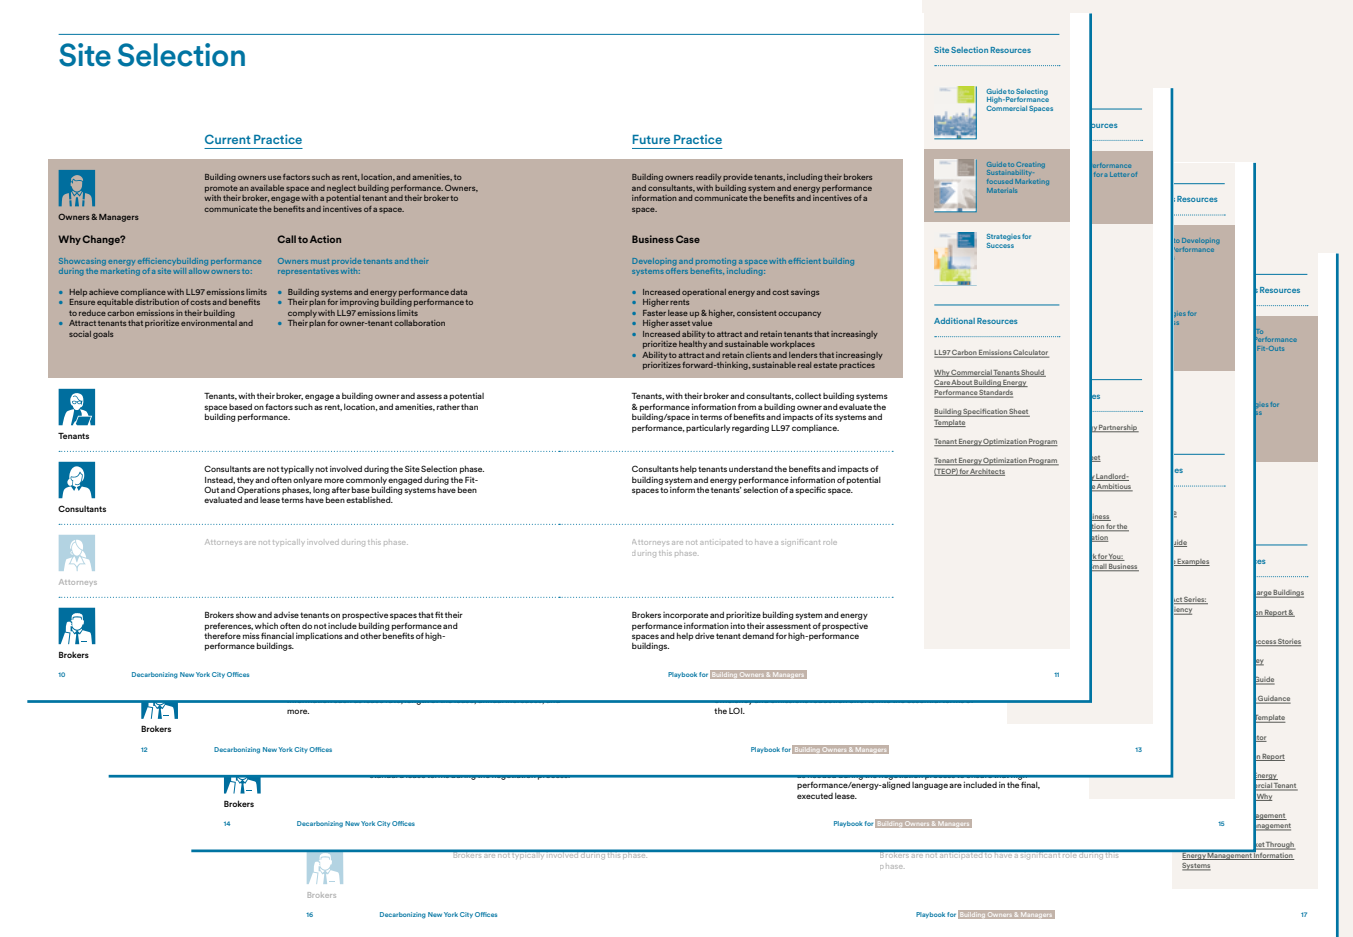

How to Use this Playbook

This playbook provides commercial real estate stakeholders with insights into how to prioritize energy efficiency and emissions reduction strategies in the leasing, design, construction, and operation of office spaces. Curated guidance and resources are organized based on strategic phases of the commercial leasing cycle, with priority given to phases that offer the greatest potential for generating change. Stakeholders should reference and revisit the information attributed to each step as office spaces within their portfolio move through various stages of the leasing cycle.

How to Use these Resources

The resources included in this playbook help stakeholders at key phases of the commercial leasing cycle update their current practices to a new business as usual, which prioritizes energy efficiency and emissions reduction strategies. Resources relevant to **Building Owners & Managers** are highlighted to indicate that they are actionable at that particular phase. All resources are accessible via clickable links.

Site Selection

Changing Business as Usual

The [Decarbonizing New York City Offices](#) initiative assesses business as usual within the commercial real estate industry, looking for opportunities for improvement and collaboration, all to drive sustained decarbonization and energy efficiency of leased office spaces.

energy efficiency investments, decarbonization strategies, and forward-thinking leasing practices. The content of this playbook summarizes how the commercial real estate industry at large typically operates and how the industry should strategically evolve.

One crucial item the team explored further was how current industry practices are changing to meet the increasingly stringent LL97 mandates. The project team used the collected information and valuable insights amassed during this initial phase to assess ways the industry must transition from current business as usual, in which energy efficiency and carbon emission reduction efforts are not prioritized, towards future practices that promote strategic

Industry Drivers

Commercial Tenant Impacts
Tenants in leased spaces typically consume more than half of a commercial building’s energy, and sometimes more depending on factors such as tenant type, building systems, and equipment efficiency.

Building Performance Standards
Industry members must prepare to comply with regulations that require buildings to meet energy and/or emissions-based targets to curb the impacts of climate change. One such law is NYC’s Local Law 97, which requires most buildings over 25,000 sq. ft. to meet increasingly stringent carbon emissions limits or face hefty fines.

Energy Conservation Code
Building energy codes are becoming increasingly stringent, evolving from prescriptive pathways to performance-based requirements. Many codes have been updated to include efficiency measures—such as improved insulation and lighting standards—and to prioritize electrification.

Corporate Sustainability Goals
An increasing number of companies are pursuing sustainability goals, often manifesting in reduced or zero-carbon emissions objectives. These targets can often be reached, in part, by reducing building emissions through energy efficiency and electrification measures.

Reporting Requirements
Sustainability reporting is becoming more essential in order to meet the requirements of government agencies, third-party verifiers, and financial lenders.

COVID-19 Pandemic
The COVID-19 pandemic revealed a discrepancy in building occupancy versus energy consumption. Companies are now rethinking how they design and operate their office spaces to better align with actual occupancy and to ensure a safe and healthy workplace.

Current Practices

Current Practices do not take into consideration the increasingly stringent environmental and regulatory standards impacting real estate. Stakeholders often do not prioritize energy efficiency and emissions reduction strategies due to:

- Uncertainty in the market from the impacts of the COVID-19 pandemic
- A lack of understanding regarding corporate environmental goals, high-performance building standards, and/or energy code requirements, as well as the potential impacts of noncompliance
- A wide range of competing priorities
- A lack of data and/or key information to guide the design and operation of efficient office spaces
- A lack of knowledge or familiarity with energy efficient equipment, solutions, and best practices
- A lack of motivation and/or incentives to go above and beyond the status quo (e.g. minimum code requirements or basic client demands)

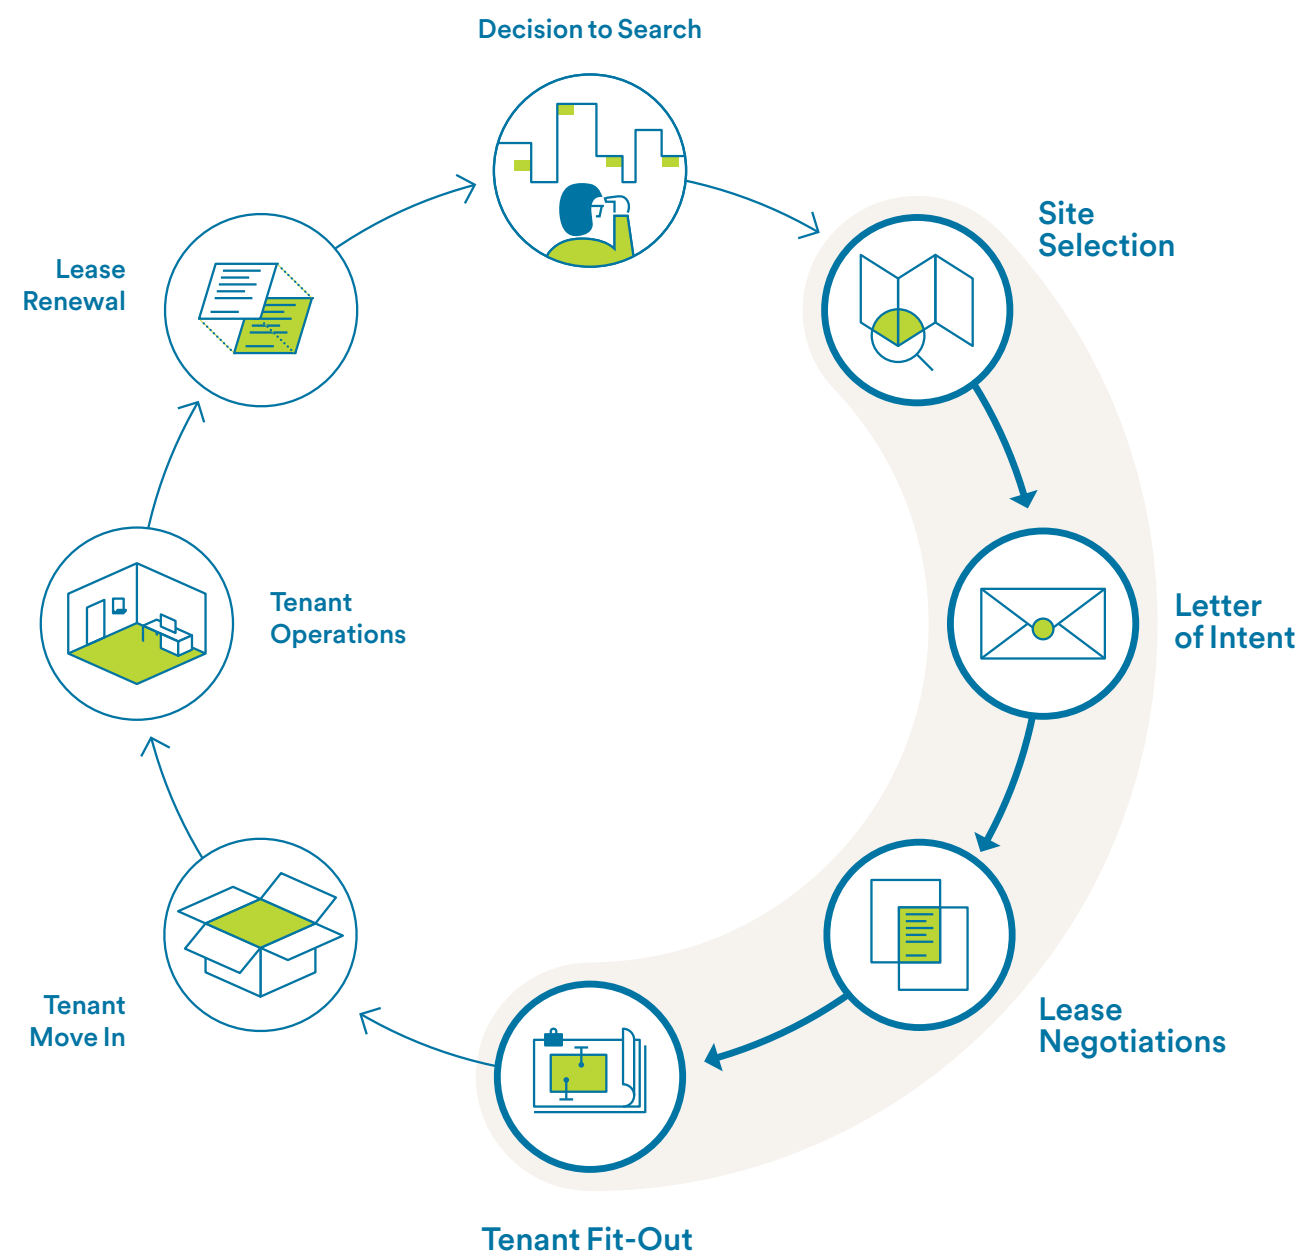

Future Practices

Future Practices evaluate the risks/ opportunities from the current and future impacts of environmental and regulatory changes. Stakeholders prioritize, pursue, implement, and monitor energy efficiency and decarbonization strategies through:

- Early engagement and continued collaboration
- Awareness regarding the benefits of and rationale for reducing the energy/carbon footprint of office spaces
- Leasing terms that are mutually beneficial and distribute responsibilities and financial needs equitably
- Accessible and ongoing data sharing

The Leasing Cycle

Within the leasing cycle of an office space, there are eight phases during which a building owner and/or a tenant evaluate changes to a leased commercial space. These steps provide opportunities to integrate meaningful energy saving and carbon reduction practices into the design and operations of a tenant space. While intervention opportunities exist within all eight steps of the leasing cycle, the four steps highlighted below are prioritized in this playbook, as they present the greatest potential for generating change.

Stakeholder Roles

There are five key stakeholders engaged at various phases of the leasing cycle, each with opportunities to affect the energy performance of tenant spaces. This playbook highlights the five stakeholders most engaged in leasing, design, and operations activities, focusing on the top three — tenants, building owners & managers, and consultants — who have the most potential impact for efficiency improvements.

Building Owners & Managers
Building owners and managers are able to optimize their buildings, creating efficient, high-performance units that lower energy costs and improve tenant comfort. They have agency over certain actions that tenants are not able to take, like upgrading base building systems to reduce fossil fuel consumption.

Tenants
Tenants have the opportunity to prioritize energy efficiency and sustainability when engaging in the leasing process and through lease modifications; retrofits during tenant fit-outs and occasional mid-lease upgrades; the operation of their space; ongoing performance data collection and real time energy management, and more.

Consultants
Consultants, such as architects and engineers, can provide technical expertise that helps tenants and building owners meet their sustainability and energy efficiency goals. These technical experts provide best practice methods and equipment specifications to optimize performance and save on utility costs.

The following stakeholders are valuable experts with a targeted role in influencing the performance of leased offices.

Attorneys
Attorneys have specific expertise regarding the commercial leases, including defining and negotiating terms. As such, attorneys can help both tenants and building owners prioritize and collaborate on efficiency and performance during the leasing process.

Brokers
Brokers are an important stakeholder as a liaison between building owners looking to lease commercial space and tenants seeking to rent commercial space. As a cohort focused on client demands, getting tenants and building owners to prioritize energy efficiency and fossil fuel use reduction is a critical initial step to gaining traction within the broker community.

The Leasing Cycle

Key to
Stakeholder
Roles

Step

How it Works Now

What Needs to Change

Who's Involved

1. Decision to Search

Tenant decides to search for an office space.

Along with identifying location, amenity, and programmatic needs, tenant clearly identifies their energy efficiency and sustainability goals and requirements.

2. Site Selection

Tenant evaluates and selects a space presented by their broker based on factors such as rent, location, and amenities, rather than building performance.

Tenant and their broker collect building systems and performance information from building owners and utilize consultants to understand the benefits and impacts of this information to inform space selection.

3. Letter of Intent

Building owner & tenant, with their respective brokers, execute a Letter of Intent (LOI) for the selected space.

Building owner and tenant, with their brokers, incorporate energy and emissions reduction language into the LOI. Attorneys conduct due diligence to verify the terms. Consultants are engaged to ensure the language aligns with current sustainability objectives.

4. Lease Negotiations

Building owner & tenant, with their respective attorneys, negotiate and execute a lease based on the LOI.

Building owner and tenant, with their attorneys, execute an energy-aligned lease that enables them to share the costs, benefits, and responsibilities. Consultants provide justification for pursuing energy efficiency measures and practices.

5. Tenant Fit-Out

Tenant, with their consultants, design, construct, and/or commission the space.

Tenants, with their consultants and in coordination with building owners, design the space with strategic energy efficient systems and practices that comply with building performance targets and integrate with base building systems.

6. Tenant Move In

Tenant moves into their new or renovated office space.

Tenant moves into their new or renovated office space. During on-boarding, management identifies various efficiency initiatives and tenant sustainability champion contacts.

7. Tenant Operations

Tenant occupies and operates the space for the lease term.

Tenant occupies and operates the space for the lease term, monitoring and optimizing their energy use regularly; sharing energy data and usage with building owners and complies with any reporting requirements.

8. Lease Renewal

Tenant decides to renew their lease or search for a new space, before their existing lease expires.

Tenant decides to renew their lease or search for a new space based on their energy efficiency and sustainability goals and requirements before their existing lease expires.

Critical phases of the leasing cycle to reduce energy use and carbon emissions in office spaces

Site Selection

Current Practice

Owners & Managers

Building owners use factors such as rent, location, and amenities, to promote an available space and neglect building performance. Owners, with their broker, engage with a potential tenant and their broker to communicate the benefits and incentives of a space.

Why Change?

Showcasing building performance during the marketing of a site will allow owners to:

- Help achieve compliance with LL97 emissions limits
- Ensure equitable distribution of costs and benefits to reduce carbon emissions in their building
- Attract tenants that prioritize environmental and social goals

Call to Action

Building Owners must provide tenants and their representatives with:

- Building systems and energy performance data
- Their plan for improving building performance to comply with LL97 emissions limits
- Their plan for owner-tenant collaboration

Future Practice

Building owners readily provide tenants, including their brokers and consultants, with building system and energy performance information and communicate the benefits and incentives of a space.

Business Case

Developing and promoting a space with efficient building systems offers benefits, including:

- Increased operational energy and cost savings
- Higher rents
- Faster lease up & higher, consistent occupancy
- Higher asset value
- Increased ability to attract and retain tenants that increasingly prioritize healthy and sustainable workplaces
- Ability to attract and retain clients and lenders that increasingly prioritize forward-thinking, sustainable real estate practices

Tenants

Tenants, with their broker, engage a building owner and assess a potential space based on factors such as rent, location, and amenities, rather than building performance.

Tenants, with their broker and consultants, collect building systems & performance information from a building owner and evaluate the building/space in terms of benefits and impacts of its systems and performance, particularly regarding LL97 compliance.

Consultants

Consultants are not typically not involved during the Site Selection phase. Instead, they are more commonly engaged during the Fit-Out and Operations phases, long after base building systems have been evaluated and lease terms have been established.

Consultants are engaged early to guide tenants in understanding the benefits and energy performance of building systems serving a prospective space. They are instrumental in comparing spaces based on performance and assessing opportunities for improvement.

Attorneys

Attorneys are not typically involved during this phase.

Attorneys are not anticipated to have a significant role during this phase.

Brokers

Brokers show and advise tenants on prospective spaces that fit their preferences, which often do not include building performance and therefore miss financial implications and other benefits of high-performance buildings.

Brokers incorporate and prioritize building system and energy performance information into their assessment of prospective spaces and help drive tenant demand for high-performance buildings.

Letter of Intent

High-Performance Clause for a Letter of Intent

Current Practice

Future Practice

Owners & Managers

Building owners, with their broker, create a LOI for review by the tenant and their broker.

Building owners, with their broker, incorporate energy efficiency and carbon emissions reduction language into the LOI. Attorneys conduct due diligence to verify the terms. Consultants are engaged to ensure the language aligns with current sustainability objectives.

Why Change?

Including energy efficiency and performance expectations at the outset of the LOI phase will allow owners to:

- Establish equitable terms with tenants for meeting LL97 requirements
- Outline energy efficiency and carbon reduction goals for their building
- Communicate the value and benefits for investing in energy efficiency to tenants

Call to Action

Building Owners must:

- Define the building performance goal to comply with LL97
- Coordinate with their broker to ensure the LOI template includes energy efficiency expectations
- Be prepared to discuss tenant improvement funds for energy efficiency upgrades with tenants
- Identify, with tenant, potential incentives and account for administrative time and costs to pursue incentives

Business Case

Incorporating energy efficiency and emissions reduction language into the LOI can help:

- Equitably distribute cost of energy efficiency improvements with tenants
- Lower operational and fit-out costs
- Ensure an agreement to fair terms with the tenant

Tenants

Tenants, with their broker, review the LOI created by the building owner and their broker.

Tenants, with their broker, incorporate energy efficiency and carbon emissions reduction language into the LOI. Attorneys conduct due diligence to verify the terms. Consultants are engaged to ensure the language aligns with current sustainability objectives.

Consultants

Consultants are not typically involved during this phase.

Consultants are included to review building and tenant performance opportunities.

Attorneys

Attorneys occasionally review LOIs, drafted by brokers for larger deals, but are often not involved in this phase.

Attorneys should ensure energy efficiency and emissions reduction language is included in the LOI in order to provide a foundation for incorporating high-performance/energy-aligned/energy-aligned language in the lease.

Brokers

Brokers draft an LOI outlining essential terms of the offer, including key information such as lease rate, length of the lease, annual increases, and more.

Brokers incorporate simple and concise language regarding energy efficiency and emissions reduction efforts into the essential terms of the LOI.

Lease Negotiations

Current Practice

Future Practice

Owners & Managers

Building owners use a standard lease with exhibits for the tenant and their attorneys to review.

Building owners advocate for energy-aligned leases that enable building owners and tenants to share the costs and benefits of investments as well as the responsibility for ensuring efficient design and operations are implemented.

Why Change?

Incorporating energy-aligned provisions into the lease will allow building owners to:

- Negotiate equitable cost-sharing for energy efficiency investments with tenants
- Seize the most potent opportunity to maximize office space and building performance at the Lease/Lease Renewal phase, as opposed to mid-lease Establish transparent data sharing and emissions limit provisions

Call to Action

Building Owners must:

- Be prepared to reframe and/or provide additional rationale to redlined or removed efficiency clauses
- Include data sharing provisions in the lease
- Define energy-aligned lease provisions that enable equitable cost-sharing between building owners and tenants

Business Case

Using high-performance, energy-aligned leases in standard leasing practices has various benefits, including the ability to:

- Ensure collaboration and transparency with the tenant
- Memorialize specific energy and emissions reduction targets to comply with LL97 and other sustainability goals
- Lower exposure to potential LL97 fines
- Equitably distribute compliance risks and responsibilities with the building tenant
- Establish policies should either party fail to meet building performance goals

Tenants

Tenants, with their attorneys, review and respond to the lease draft provided by the building owner and their attorneys.

Tenants and their teams advocate for energy-aligned leases that enable tenants and building owners to share both the costs and benefits of investments, as well as the responsibility for ensuring efficient design and operations are implemented.

Consultants

Consultants are not typically involved during this phase.

Consultants are engaged and provide justification for pursuing energy efficiency measures and practices, such as rationale, benefits, costs, financial returns, and reduced financial risk implications.

Attorneys

Attorneys draft, analyze, and advise their respective tenant and building owner clients about the lease agreement as well as facilitate the lease term negotiations.

Attorneys include high-performance/energy-aligned lease language within both the standard lease draft as well as the final, executed version.

Brokers

Brokers may review the draft lease or advise attorneys as needed on standard lease terms during the negotiation process.

Brokers review the draft lease agreement and advise attorneys as needed during the negotiation process to ensure that high-performance/energy-aligned language are included in the final, executed lease.

Tenant Fit-Out

Current Practice

Owners & Managers

Building owners coordinate with tenant and consultants as needed during the design, construction, and commissioning of the space.

Why Change?

Actively engaging with tenants and consultants during fit-out will allow building owners to:

- Optimize system integration between base building systems and tenant supplement systems
- Incorporate energy efficiency measures and practices as a basis of design
- Maximize decarbonization impact and benefits

Call to Action

Building Owners must:

- Continue to coordinate with consultants and tenants to optimize system integration and operations

Future Practice

Building owners coordinate with tenant and consultants throughout the design, construction, and commissioning of the space to ensure it is designed to meet building performance targets.

Business Case

Collaborating with tenants and consultants during fit-out can have whole building benefits, including:

- Increased operational energy and cost savings
- Lowered exposure to potential LL97 fines in the event of noncompliance
- Increased ability to attract and retain tenants that increasingly prioritize healthy and sustainable workplaces
- Ability to attract and retain clients and lenders that increasingly prioritize forward-thinking, sustainable real estate practices

Tenants

Tenants engage consultants to design, construct, and/or commission the space and coordinate logistics with building owners.

Tenants engage consultants and coordinate with building owners to design the space to comply with building performance targets and to integrate with base building systems.

Consultants

Consultants coordinate with the tenant and/or building owner as needed on the design, construction, and commissioning of the office space.

Consultants design the tenant space with energy efficient systems and practices that comply with building performance targets and integrate with base building systems. Consultants participate in project kick-off, charrettes, and coordination meetings to advise and ensure high-performance measures are properly executed.

Attorneys

Attorneys are not typically involved during this phase.

Attorneys are not anticipated to have a significant role during this phase.

Brokers

Brokers are not typically involved during this phase.

Brokers are not anticipated to have a significant role during this phase.

Conclusion

Decarbonizing the building sector is a crucial step towards meeting New York’s ambitious climate goals, such as the state’s mission under the Climate Leadership & Community Protection Act to achieve 85% carbon emissions reductions from 1990 levels by 2050.

In recent years, significant efforts have been devoted to curbing emissions from the commercial building stock. Increasingly stringent regulatory standards – from local laws to energy codes to disclosure requirements – have pushed commercial real estate towards more energy efficient, low/no-carbon properties. These evolving regulations aim to address both operational inefficiencies and the broader impact of buildings on the environment. Additionally, more and more companies are pursuing corporate sustainability goals in recognition of the diverse benefits of improving the performance of real estate assets. Implementing energy efficiency measures in commercial buildings and tenant spaces not only reduces costs and carbon emissions, but creates healthy, comfortable work environments that enhance employee satisfaction and productivity. In tandem, these external and internal drivers further advance commercial building decarbonization.

Heightened building performance requirements and corporate sustainability goals spotlight the office tenants’ significant role in whole building performance. Tenants are responsible for more than half of a

commercial building’s energy use and its corresponding carbon emissions. If the industry is to produce substantial and sustained emissions reductions, business as usual practices must evolve across all stages of the leasing cycle—from how tenants select spaces, to how leases are structured, and how offices are retrofitted and operated. A paradigm shift is needed to bring tenants and owners, along with their respective teams, to the table to proactively and collaboratively develop strategic decarbonization plans.

The Decarbonizing New York City Offices initiative advances the transition to forward-thinking real estate practices that prioritize efficiency and decarbonization efforts by assessing current stakeholders’ positions and providing strategies to help overcome typical barriers. This initiative recognizes the opportunity that all stakeholders—including tenants, owners, designers, energy consultants, brokers, and legal experts—have to create high-performance leased office spaces. As such, this playbook highlights how teams across disciplines can work together to achieve win-win scenarios. The resources throughout provide insights and actionable guidance for each stage of the lease cycle. Our project team strongly encourages readers to refer to this playbook, assess how their current practices can evolve, and leverage the various tools over the course of an asset’s lease term. We are hopeful that these resources will empower practitioners in the commercial real estate industry as we strive to decarbonize office buildings in New York City and beyond.

Glossary of Key Terms

Relevant to decarbonization efforts within the commercial building industry.

BREEAM

Building Research Establishment Environmental Assessment Methodology (BREEAM) is a method of assessing, rating, and certifying a building’s environmental sustainability.

Building Management Systems (BMS)

A control system installed in a building that monitors and manages various systems such as heating, ventilation, air conditioning (HVAC), and lighting systems. A BMS automatically regulates and controls internal environmental conditions, such as temperature, to predefined set points. In addition to monitoring building systems, a BMS also optimizes energy use so that the system is as efficient as possible.

Building Performance Standards (BPS)

Outcome-based policies and laws aimed at reducing the carbon impact of the built environment by requiring existing buildings to meet energy and/or greenhouse gas emissions-based performance targets.

Building Letter Grades aka Building Energy Grades aka Building Energy Efficiency Ratings aka Local Law 95 of 2019 (LL95)

Requires certain buildings above 25,000 square feet to post an energy efficiency grade at each public entrance. Building Energy Efficiency Rating labels include an ENERGY STAR score and a corresponding letter grade indicating the building’s energy performance relative to its peers.

Carbon, Embodied

Embodied carbon is the total greenhouse gas emissions released during the lifecycle of building materials, including extraction, manufacturing, transportation, construction, and disposal.

Carbon, Operational

Operational carbon is the total carbon from all energy sources used to keep a building warm, cool, ventilated, lighted, and powered.

Climate Leadership and Community Protection Act (Climate Act, CLCPA)

New York State law passed in 2019 that outlines a path for achieving net zero emissions, economy-wide, by 2050.

Climate Mobilization Act (CMA)

New York City legislation passed in 2019 aimed at reducing carbon emissions from buildings, this legislation consists of a slate of climate laws, including Local Law 97, designed to dramatically cut carbon in New York City.

ENERGY STAR score

An energy efficiency score (1-100) that a building earns using the United States Environmental Protection Agency’s online benchmarking tool, ENERGY STAR Portfolio Manager to compare building energy performance to similar buildings in similar climates. See Building Letter Grades.

ENERGY STAR Tenant Space

An EPA recognition for sustainability efforts in a leased office space.

Energy Use Intensity (EUI)

Energy Use Intensity (EUI) expresses a building’s energy use as a function of its size or other characteristics. EUI is expressed as energy per square foot per year and is calculated by dividing the total energy consumed by the building in one year (typically measured by kBtu) by the total gross floor area of the building.

Fitwel

A real-estate certification system that evaluates the health-affecting aspects of buildings to improve occupant well-being

LEED

“Leadership in Energy and Environmental Design” (LEED) is a green building rating system with multiple categories for different building and space types, providing a framework for healthy, efficient green buildings.

Local Law 97 of 2019 (LL97)

New York City law that requires most buildings larger than 25,000 square feet to meet strict greenhouse gas emissions limits starting in 2024. This new law is expected to reduce cumulative emissions from large buildings at least 40% citywide by 2030 through building retrofits.

Letter of Intent (LOI)

A letter of intent is a document used to indicate that both a tenant and building owner have agreed to move forward to a lease.

Real Time Energy Management (RTEM)

A system that continuously collects and transmits a building’s current and historical performance data to the cloud. An RTEM system can detect equipment faults, so they can be addressed before they become failures or impact occupant comfort.

WELL

A performance-based system for measuring, certifying, and monitoring features of the built environment that impact human health and well-being, through air, water, nourishment, light, fitness, comfort and mind.

Project Team

Katie Schwamb, Building Energy Exchange
Richard Yancey, Building Energy Exchange
Audi Banny, Institute for Market Transformation
Diana Lee, Institute for Market Transformation
Marla Thalheimer, Institute for Market Transformation
Stephanie Margolis, NYC Climate Action Alliance
Jeff Gracer, NYC Climate Action Alliance
Eugenia Gregorio, Principal at Gregorio Sustainability LLC
Sophie Cardona, NYSERDA
Mayra Lujan, NYSERDA

Steering Committee

Mark Ambrosone, Vornado Realty Trust
Thomas Baade-Mathiesen, CoreNet NYC Chapter
Michael Barry, Bloomberg LP
Harry Etra, HXE Partners
Jason Gorman, CBRE, Inc.
Stuart Kaplan, Blank Rome
Yasemin Kologlu, SOM
Martin S. Konikoff, Robert Derector Associates
Natasha Lewis, Calvin Klein, Inc.
Molly Dee-Ramasamy, Jaros, Baum & Bolles
Lauren Moss, Vornado Realty Trust
Ray Pezzuti, Fried Frank
Cindy Quan, Barclays Corporate & Investment Bank
Colm Ralph, Savills North America
John Rice, Legacy Engineers
Luis Rios, Simone Development Companies
Zach Steinberg, Real Estate Board of New York
Mallory Taub, Gensler
Jo-Ann Whitehorn, TF Cornerstone
Alvis Yuen, Bain Capital

Special Thanks

Heather Betz, Boston Properties
Amy Boyce, Institute for Market Transformation
Chris Cayten, CodeGreen Sustainability
Michael Daschle, Brookfield Properties
Jonathan Flaherty, Tishman Speyer
Cody Glavey-Weiss, NYSERDA
Katie Gonzalez, Boston Properties
Jack Jenkins, Robert Derector Associates
Heather Kahn, Boston Properties
Stuart Kaplan, BlankRome
Adrienne La Forte, Building Energy Exchange
Andrew Levin, Boston Properties
Ann Mantha, NYSERDA
Kaylee McGowan, Building Energy Exchange
Hailey Moll, Building Energy Exchange
Ben Myers, Boston Properties
Karen Oh, Vornado Realty Trust
Jared Rodriguez, NYSERDA
Alexis Saba, Sive, Paget, & Riesel
Dana Schneider, Empire State Realty Trust
Neetu Siddarth, Boston Properties
Brock Talbot, Empire State Realty Trust

Abbreviations

AHU	Air handling unit
BAU	Business as usual
BMS	Building management system
CapEx	Capital expenditures
CHP	Combined heat and power
CLCPA	Climate Leadership & Community Protection Act
CO2	Carbon dioxide
DCV	Demand controlled ventilation
DHW	Domestic Hot Water
DOAS	Dedicated outside air system
ECM	Energy conservation measure
EPD	Environmental Product Declaration
ERM	Emissions reduction measures
ERV	Energy recovery ventilation
ESG	Environment, social, and governance
GHG	Greenhouse gas
GRI	Global Reporting Initiative
HVAC	Heating, ventilation, and cooling systems
HW	Hot water
IRR	Internal rate of return
LEDs	Light-emitting diode lights
LL97	Local Law 97
LPD	Lighting power density
MEP	Mechanical, electrical, and plumbing systems
M&V	Measurement and verification
NPV	Net present value
RTEM	Real-time energy management system
SASB	Sustainability Accounting Standards Board
SBTi	Science Based Targets initiative
VAV	Variable air volume
VFD	Variable frequency drive

The Building Energy Exchange is a center of excellence dedicated to reducing the effects of climate change by improving the built environment. BE-Ex accelerates the transition to healthy, comfortable, and energy efficient buildings by serving as a resources and trusted expert to the building industry.
